

The BG-Lure cartridge with excellent emission profile

The BG-Lure cartridge, especially used by scientists and health-care specialists to monitor mosquito populations, comes as a plastic cartridge filled with three components in granular form. Specified openings of the cartridge allow a controlled release of the volatile components.

The BG-Lure cartridge provides

- **easy handling** – no contact with the components.
- **protection** of the odor **against environmental influence** – the plastic cover protects the components against washing out and extends the durability.
- **excellent emission profile** – a more consistent emission rate in comparison to the former version of the BG-Lure provides a more constant mosquito catch rate over time.

Handling of the BG-Lure cartridge

Before placing the cartridge in the trap unwrap the plastic cover from the BG-Lure cartridge [F1].

The unwrapped BG-Lure cartridge [F2] can be placed in the old BG-Sentinel [F3] and BG-Mosquitoire traps [F4] at the same place as the former BG-Lure. In the BG-Sentinel 2 it fits into an opening in the trap cover [F5].
